Summary

Software engineer with experience building FAA air-traffic surveillance features in Java, Spring, Angular and PostgreSQL. Now develops radar test software at SRCTec. Shipped a Next.js and TypeScript trip planner with local storage, optional sync and automated release checks.

Skills

Languages: Java, Python, TypeScript, JavaScript, SQL, HTML/CSS

Development: Spring Boot, Angular, React, Next.js, Express, PostgreSQL, MongoDB, REST APIs

Testing and tools: Playwright, Vitest, JUnit, axe-core, GitHub Actions, Git, LabVIEW, TestStand

Experience

SRCTec August 2025 - Present

Test Engineer | North Syracuse, NY

- Develop and maintain radar production test software in LabVIEW, TestStand and Python, including in-house applications and third-party package integrations.
- Fixed an FPGA programming failure with a post-programming power cycle. That step's first-time pass rate rose from 0% to 100%, cutting two test runs to one.
- Restored production after a Windows 11 upgrade broke TI Fusion detection for PMIC programming; traced the regression and shipped a hotfix.
- Migrated LabVIEW 2016 test software to 2021 across 8 packages in under 3 months, fixing compatibility issues.

SRCTec June 2024 - August 2024

Test Engineering Intern | North Syracuse, NY

- Automated radar delay-line and RF-switch settings with Python over HTTPS, reducing manual effort by about 40%.
- Resolved 15 library issues and upgraded Python 2.7 to 3.10, improving testing speed by about 25%.

Saab Inc. January 2023 - August 2023

Software Engineering Co-op | East Syracuse, NY

- Shipped an Air Situation Display feature showing all aircraft within a selected radius, replacing a top-aircraft-only view.
- Connected the Angular front end and Java back end through APIs to integrate SysMon into an FAA surveillance system.
- Filtered low-quality ADS-B and MLAT data for about 20% better accuracy; optimized PostgreSQL queries for about 2x faster retrieval.

Projects

Nepal x Japan Trip Planner June 2026 - Present

Solo project | github.com/Powan55/trip_planner

- Shipped a Next.js, React and TypeScript PWA on GitHub Pages. A service worker caches the app shell; plans use localStorage, photos use IndexedDB, and Firestore sync is optional.
- Added Playwright, Vitest and axe-core checks in GitHub Actions, with a version gate before publishing.

Single Pane of Glass August 2024 - May 2025

RIT capstone sponsored by LenelS2 (Honeywell) | Team of 5

- Migrated the monitoring dashboard's React front end to TypeScript and Material UI; built login, user creation and role-based access in the Express/MongoDB user service.

Education

B.S. in Software Engineering, Rochester Institute of Technology May 2025
